

Shared raters and uncertainty in ability differences

2 persons $\times$ 2 raters $\times$ 2 criteria | Fixed calibration | Development illustration

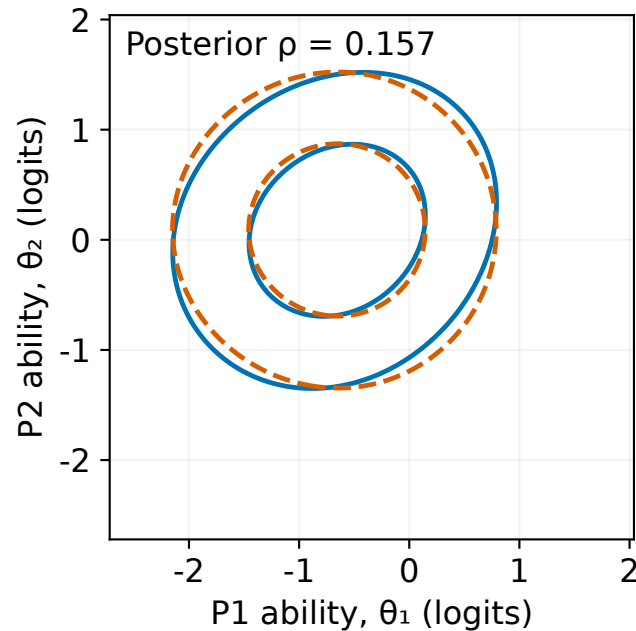

A Shared rater effects

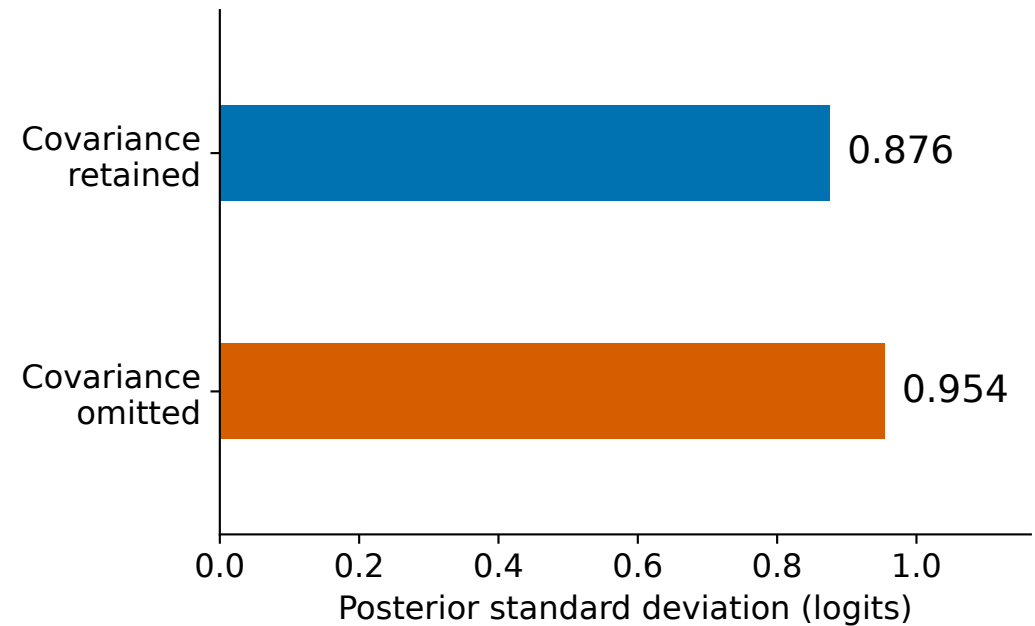

B Person-rater local effects

C Joint posterior of ability

D SD of the ability difference $\theta_1 - \theta_2$

Same marginals; only dependence is removed

- Joint posterior under the shared-rater model
- - - Product of its marginals (not a fit of model B)

Contours: approximate 50% and 90% highest-density regions. Development evidence, not a package plot API.
